

Chapter 9

Problem 34

$$\theta = 30^\circ$$

$$\vec{v}_0 = 25 \text{ m/s}$$

$$m = 250 \text{ g} = 0.25 \text{ kg}$$

what is The momentum after 0.20s?

~~First~~ The initial momentum magnitude is

$$p = m v = (0.25 \text{ kg})(25 \text{ m/s})$$

$$= \underline{\underline{6.25 \text{ kg m/s}}}$$

In unit ~~vector~~ vector notation

$$\vec{v}_0 = 25 \cos 30^\circ \hat{i} + 25 \sin 30^\circ \hat{j}$$

$$= (21.7 \hat{i} + 12.5 \hat{j}) \text{ m/s}$$

and initial momentum vector is

$$\vec{p}_0 = (0.25 \text{ kg})(21.7 \hat{i} + 12.5 \hat{j}) = \boxed{(5.43 \hat{i} + 3.13 \hat{j}) \frac{\text{kg m}}{\text{s}}}$$

In The horizontal direction The momentum & velocity is unchanged,

In The vertical direction gravity is accelerating The ball downward. After $\Delta t = 0.20 \text{ s}$, The new vertical

velocity is

$$\text{y-direction} \rightarrow v = v_0 + at = \frac{12.5}{\cancel{12.5}} - (9.8)(0.20) = \frac{10.5 \text{ m/s}}{\cancel{12.5 \text{ m/s}}}$$

The new velocity is

$$\vec{v}_1 = (21.7 \hat{i} + 10.5 \hat{j}) \text{ m/s}$$

The new momentum is

$$\vec{p} = (0.25 \text{ kg})(21.7 \hat{i} + 10.5 \hat{j}) = \boxed{(5.43 \hat{i} + 2.63 \hat{j}) \frac{\text{kg m}}{\text{s}}}$$

The new magnitude of The momentum is

$$p = \sqrt{(5.43)^2 + (2.63)^2} = \underline{\underline{6.03 \frac{\text{kg m}}{\text{s}}}}$$

The angle of travel of The ball is

$$\theta = \tan^{-1}\left(\frac{2.63}{5.43}\right) = \underline{\underline{25.8^\circ}}$$
